

MODULAR DECK
ABSTRACT OF THE DISCLOSURE

A modular decking system and decking components are used to assemble a deck. One or more prefabricated decking modules are supported by an outer rectangular frame to provide a finished deck having the appearance of a custom stick built deck. Each deck module comprises a base having deck flooring attached to provide an overhang of the deck flooring and an exposed base edge on opposite sides of the base. The deck module base is sized so that each end of the deck flooring extends beyond each end of the deck module base by an amount sufficient to provide support. The ends of the deck flooring are attachable to the opposite ends of the outer rectangular frame, which provide the support for each of the deck modules.
